## INNOVATION

- Pom supported profiles are nearly 40% lighter than metal supported profiles.
- It can be smoothly stretches every direction with its more flexible structure.
- It can return back initial form immediately when stretched and release with its memorable structure.
- It does not make corrosion and rust in time like metal supported porfiles.
- During the production periods processing of the product is more easy than metal supported profiles.
- Because of Pom inner supported material is not metal, it does not give any harm to the human health like cut and chip during the montage.
- Because of Pom supported material is not conductive, it can be used as cable protection-coating material where electrical cables are available.
